During the second dekad of November 2011, the northern hemisphere high pressure cells, the Azores and Siberian highs and Arabian ridge remained intense. The southern hemisphere high pressure cells, Mascarene high continued to relax while occasional intensification of St. Helena was observed, thus continued to support the southwards movement of the Inter-Tropical Convergence Zone (ITCZ) over the northern parts of the country. Southeasterly and southwesterly low level winds dominated the eastern parts of the country during this dekad. Convergence of winds from west and southeasterly winds from the east were observed over the Lake Victoria basin and the northern coast. This configuration resulted into enhanced activities over the basin and the northern coast.

During the dekad under review, significant amounts of rainfall were observed over Lake Victoria basin and northern coast. The northeastern highlands experienced less rainfall activities characterized by dry spells. Most of the unimodal sector received rainfall below 30 mm. The highest amount of rainfall was recorded in Dar es Salaam 206.2 mm, followed by Kizimbani 157.0 mm, Zanzibar Airport 146.8 mm, Shinyanga 129.8 mm, Pemba 105.0 mm, Kibondo 104.8 mm, Mlingano and Tabora 28.8 mm each. Remaining stations from our sample reported rainfall not exceeding 20 mm as shown in Figure 1 below.

 schlechte发音
Mara, Kilimanjaro, Arusha and Tanga regions) with state of crops being generally good. On the other hand planting and final land preparation were the major farming activities over unimodal sector.

Hydrometeorological Summary
Water levels in lakes, dams and river flow discharges were slightly boosted.

Environmental Summary
Temperatures mostly over high ground areas in the country were fairly cool except along the coastal belt and a few inland areas where they were generally warm. Low relative humidity dominated over most areas but is getting higher along the coastal belt.

Lake Victoria Basin (Kagera, Mara, Shinyanga, and Mwanza regions): Thundery showers are expected to prevail over the region. Mara region is expected to feature slightly enhanced rainfall.

Western region (Tabora and Kigoma regions): is expected to feature slightly enhanced rainfall.

Northern coast and its hinterland (Dar es Salaam, Morogoro, Tanga and Coast regions, Isles of Unguja and Pemba): These areas are expected to experience isolated rain showers.

Southern Coast (Mtwara and Lindi regions): Mainly dry conditions with sunny periods expected over the region.

Northeastern highlands (Arusha, Kilimanjaro and Manyara regions): These areas are expected to feature some rainfall and thunderstorms.

Southwestern highlands (Rukwa, Mbeya and Iringa regions): Partly cloudy conditions, rain showers with isolated cases of thunderstorms are expected. Southern region (Ruvuma region): Partly cloudy conditions and sunny periods are expected. Central region (Dodoma and Singida regions): These areas are expected to feature some rain showers. Northern parts of these regions are likely to experience more rains.
